

Native Tree Species Of Georgia By Coder Planting Zones

Dr. Kim D. Coder, Professor of Tree Biology & Health Care, Warnell School, UGA

Native tree species surround us, representing a great ecological bounty and a rich cultural history in Georgia. Native trees live from the mountains to the sea in many diverse habitats and under many environmental constraints. Native trees add value, comfort, and beauty to life in Georgia. They have provided medicine, food, fiber, shelter, recreation and aesthetic values. Native trees witnessed the arrival of many groups of explorers and settlers, many groups of Native Americans, and a number of ice ages. Native trees are wonderfully adapted to a local area's climate, soils, pests and other plants. There is a native tree well-suited for most planting sites or landscapes.

A "tree" is defined as a perennial, woody, single-stemmed plant capable of attaining a size greater than 15 feet in total height and greater than 4 inches in stem diameter. A "native" tree is found within the last three centuries growing wild and reproducing naturally, and not introduced to an area by human activities. A tree is considered "native in Georgia" if it was not originally brought to Georgia by people, it is found growing and reproducing naturally in the Georgia landscape, and its gene sets developed and succeeded under Georgia's environmental conditions before human dominance of the land.

Key to proper selection of a native tree for planting on any particular site is assuring it can handle various climatic and micro-site characteristics. One critical value for native trees is surviving and thriving under the normal temperature and precipitation regimes expected on a site. This attribute of surviving and thriving under normal, average temperature and precipitation conditions is summarized into Coder Tree Planting Zones (CTPZ). The Coder Tree Planting Zone map for Georgia is given in Figure 1.

Most trees can do well for many years beyond their planting zones, especially in high quality or protected areas. Young trees are much more tolerant of environmental constraints than are older trees. Coder tree planting zones help demonstrate where native tree species should perform best. Tree planting close to a tree species' native range, as shown in this publication, will help you design and plant an effective and efficient native landscape.

Figure 2 = trees growing in CTPZ #1 -- 112 species; Figure 3 = trees growing in CTPZ #2 -- 113 species; Figure 4 = trees growing in CTPZ #3 -- 102 species; Figure 5 = trees growing in CTPZ #4 -- 105 species; Figure 6 = trees growing in CTPZ #5 -- 123 species; Figure 7 = trees growing in CTPZ #6 -- 139 species; Figure 8 = trees growing in CTPZ #7 -- 116 species; Figure 9 = trees growing in all CTPZs in Georgia -- 35 species (CTPZ #1-7 -- a statewide planting distribution).
